

Types ACE95 and ACE95Sr Tank Blanketing Valves

Figure 1. Type ACE95 Tank Blanketing Valve

Figure 2. Type ACE95Sr Tank Blanketing Valve

Features

- Fully Balanced Pilot Design
Reduces Inlet Pressure Sensitivity
- Frictionless Pilot Valve
- Bubble Tight Shutoff
- Pilot Controlled
- Angled or In-Line Body Option
- Self-Contained
- Highly Sensitive
- Diagnostics Available
- Vacuum Settings Available
- Stainless Steel
Construction Available

Bulletin 74.1:ACE95

Specifications

The Specifications section lists the specifications for Types ACE95 and ACE95Sr Tank Blanketing Valves. Factory specification is stamped on the nameplate fastened on the valve at the factory.

Sizes and End Connection Styles

Type ACE95

Angled Body⁽¹⁾:

3/4 NPT

1 NPT

NPS 1 / DN 25, CL150 RF

NPS 1 / DN 25, CL300 RF

NPS 1 / DN 25, PN 16/25/40 RF

NPS 1 / DN 25, Sanitary Flange

In-Line Body:

3/4 NPT

1 NPT

NPS 1 / DN 25, CL150 RF

NPS 1 / DN 25, CL300 RF

NPS 1 / DN 25, PN 16/25/40 RF

NPS 1 x 2 / DN 25 x 50, CL150 RF

NPS 1 x 2 / DN 25 x 50, PN 16/25/40 RF

NPS 1 / DN 25, Sanitary Flange

Type ACE95Sr

Angled Body⁽¹⁾:

2 NPT

NPS 2 / DN 50, CL150 RF

NPS 2 / DN 50, CL300 RF

Maximum Operating Inlet Pressure⁽²⁾

200 psig / 13.8 bar

Maximum Emergency Outlet (Casing) Pressure⁽²⁾

20 psig / 1.4 bar

Maximum Operating Outlet Pressure⁽²⁾

1.5 psig / 0.10 bar

Outlet Pressure Ranges

-5 in. w.c. to 1.5 psig / -12 to 0.10 bar

Minimum and Maximum Differential Pressures⁽²⁾

Minimum: 25 psi / 1.7 bar

Maximum: Up to 200 psi / 13.8 bar depending on main valve spring (See Table 6)

Main Valve Flow Characteristic

Linear

Pressure Registration

External

Accuracy

Typically within 0.5 in. w.c. / 1 mbar when flowing 5 to 70 percent of advertised capacities

Temperature Capabilities⁽²⁾

Nitrile (NBR): -20 to 180°F / -29 to 82°C

Fluorocarbon (FKM): 0 to 212°F / -18 to 100°C

Ethylene propylene (EPDM - FDA):

-20 to 212°F / -29 to 100°C

Perfluoroelastomer (FFKM):

-20 to 212°F / -29 to 100°C

IEC Sizing Coefficients

Type ACE95⁽³⁾:

X_T: 0.72

F_D: 0.40

F_L: 0.89

K_m: 0.79

Type ACE95Sr:

X_T: 0.72

F_D: 0.46

F_L: 0.89

K_m: 0.79

Flow Coefficients for Relief Valve Sizing

Type ACE95:

C_v 1 use C_v 1.1

C_v 2 use C_v 2.2

C_v 4 use C_v 4.4

C_v 7.5 use C_v 9.25

C_v 10 use C_v 11

Type ACE95Sr:

C_v 20 use C_v 22

C_v 45 use C_v 50

C_v 60 use C_v 66

Construction Materials

Body: CF3M/CF8M Stainless steel

Trim: 304 Stainless steel and 316 Stainless steel

Elastomers: Nitrile (NBR), Fluorocarbon (FKM), FDA-Ethylene propylene (FDA-EPDM) or Perfluoroelastomer (FFKM)

Diaphragm: Fluorinated ethylene propylene (FEP)

Actuator: 316 Stainless steel or Carbon steel

Approximate Weights (with all accessories)

Type ACE95: 40 lbs / 18 kg

Type ACE95Sr: 60 lbs / 27 kg

1. Various Single Array Manifold (SAM) tank connections are also available. Contact your local Sales Office for more information.

2. The pressure/temperature limits in this Bulletin or any applicable standard limitation should not be exceeded.

3. For NPS 1 / DN 25 body size, all trims.

Introduction

Tank blanketing is the process of using a gas, such as nitrogen, to maintain a slightly positive pressure in an enclosed storage tank. Tank blanketing prevents a stored product from vaporizing into the atmosphere, reduces product combustibility and prevents oxidation or contamination of the product by reducing its exposure to air. Tank blanketing is utilized with various products, including: adhesives, pharmaceuticals, pesticides, fertilizers, fuels, inks, photographic chemicals and food additives.

Types ACE95 and ACE95Sr valves are self-contained, fully balanced, pilot-operated and are used for accurate pressure control on tank blanketing systems. These valves help control emissions and provide protection against atmospheric contamination. Types ACE95 and ACE95Sr valves maintain a positive tank pressure which reduces the possibility of tank wall collapse during pump out operations, prevents stored product from vaporizing to atmosphere. The Type ACE95Sr uses an angled body in either a 2 NPT, CL150 RF or CL300 RF and is taller than the Type ACE95.

Features and Benefits

- **Pilot Controlled**—ACE95 Series valves are pilot operated which results in a high degree of accuracy and control.
- **Fully Balanced Pilot**—Eliminates setpoint changes caused by variations in inlet pressure.
- **Large Actuator**—Large actuator diaphragm increases sensitivity to tank pressure changes.
- **Rolling Pilot Diaphragm**—The rolling diaphragm balances the pilot valve and eliminates friction, resulting in extremely accurate control.
- **Diagnostic Port**—Allows field analysis of valve operation, simplifying maintenance and reducing service costs.

Options and Accessories

- **Inlet Pressure Gauge**—Displays pressure of blanketing gas supply to the tank blanketing valve.
- **Control Pressure Gauge**—Low-pressure gauge to measure control pressure (tank pressure).
- **Purge Meter (Rotameter)**—Maintains a small amount of flow through the sensing and/or main line. Prevents corrosive tank vapors from damaging upstream equipment.
- **Pressure Switch**—Allows installation of an alarm system to indicate low or high-pressure on the tank.
- **Outlet Check Valve**—Prevents corrosive gases and vapors from flowing back into the blanketing system through the delivery line.
- **Diagnostic Gauge**—Allows analysis of valve operation in the field, simplifying service and reliability.
- **Single Array Manifold (SAM)**—Provides sense line connection and main valve connection through a single tank nozzle. (Not compatible with In-Line end connection).

Principle of Operation

Types ACE95 and ACE95Sr tank blanketing valves control the vapor space pressure over a stored liquid. When liquid is pumped out of the tank or vapors in the tank condense, the pressure in the tank decreases. Tank pressure is sensed by the large actuator diaphragm. When tank pressure is less than the valve set pressure, spring force moves the actuator diaphragm downward.

When the actuator moves downward, it pushes open the pilot valve which allows loading pressure to flow into the tank. As loading pressure decreases, inlet pressure is able to overcome the force of the main valve spring, opening the main valve. See Figure 3.

When pressure in the tank increases above setpoint, the large actuator diaphragm is pushed upward, allowing the pilot to close. Loading pressure equalizes with inlet pressure closing the main valve.

The pilot valve is balanced (inlet pressure creates equal upward and downward force on these components); therefore, the outlet pressure of the unit is not affected by fluctuating inlet pressure.

Figure 3. Type ACE95 Operational Schematic

Diagnostics

Tank blanketing valves are often installed in locations that are difficult to access. Types ACE95 and ACE95Sr valves are available with a diagnostics feature that allows analysis of valve operation in the field, making maintenance easier and more reliable.

The diagnostics feature uses the relationship between pressure in the pilot and main valve chambers to analyze valve performance.

Sizing Methods

Direct Displacement

The direct displacement method should be used with extreme caution. The direct displacement method determines the amount of blanketing gas required to replace liquid pumped out of the tank. Direct displacement does not allow for fluctuating temperature or other factors that may affect pressure in the vapor space. This method is typically applied to tanks operating at constant temperature and containing non-flammable, non-volatile products.

$$Q_{\text{total}} = Q_{\text{pump}}$$

where,

- Q_{total} = Required Flow Rate
- Q_{pump} = Required Flow Rate to replace pumped out liquid from Table 1

API 2000

The American Petroleum Institute Standard 2000 (API 2000) sizing method accounts for liquid pump-out as well as contraction of tank vapors due to cooling. When using API methods:

$$Q_{\text{total}} = Q_{\text{pump}} + Q_{\text{thermal}}$$

where,

- Q_{total} = Required Flow Rate
- Q_{pump} = Required Flow Rate to replace pumped out liquid from Table 1
- Q_{thermal} = Required Flow Rate due to thermal cooling. See Thermal Equations 1 to 4 below or Table 2.

Thermal Equations

For tanks up to 840,000 gallons / 3179 m³ capacity, use one of the following equations:

Equation 1:

$$Q_{\text{thermal}} [\text{SCFH Air}] = V_{\text{tank}} \times 0.0238$$

Equation 2:

$$Q_{\text{thermal}} [\text{SCFH Nitrogen}] = V_{\text{tank}} \times 0.0238 \times 1.015$$

Equation 3:

$$Q_{\text{thermal}} [\text{Nm}^3/\text{h Air}] = V_{\text{tank}} \times 0.169$$

Equation 4:

$$Q_{\text{thermal}} [\text{Nm}^3/\text{h Nitrogen}] = V_{\text{tank}} \times 0.169 \times 1.015$$

where,

- For Equations 1 and 2: V_{tank} = tank volume, gallons
- For Equations 3 and 4: V_{tank} = tank volume, m³

For tanks greater than 840,000 gallons / 3179 m³ capacity: See Table 2.

Depending on the method, there can be a significant difference in the calculated required capacity. **No matter which method is used, the tank must be equipped with supplemental venting to protect the tank, product and personnel in cases of equipment failure, fire exposure or other conditions that could cause the tank pressure or vacuum to exceed operating limits.**

Capacity Information

Capacity information (Tables 2, 3, 4 and 5) are based on 0.97 specific gravity nitrogen. Nitrogen is the most common blanketing gas. Should you use a different gas, convert the tabular values as follows: For blanketing (pad) gases other than nitrogen, multiply the given nitrogen flow rate values by the conversion factors in Table 3. For gases of other specific gravities, multiply the given nitrogen flow rate by 0.985 and divide by the square root of the appropriate specific gravity.

Bulletin 74.1:ACE95

Table 1. Flow Rate Conversion⁽¹⁾

- 51 to 120 psig / 3.5 to 8.3 bar
- 121 to 200 psig / 8.3 to 13.8 bar

Options (Select Desired Options)

- Stainless steel Filter in lieu of standard Aluminum/Zinc
- Inlet Pressure Gauge, Stainless steel
- Control Pressure Gauge, Dwyer®
- Control Gauge, Stainless steel, for setpoint below 2 in. w.c. / 5 mbar
- Control Gauge, Stainless steel, for setpoint above 2 in. w.c. / 5 mbar
- Sensing Line Purge, Acrylic
- Sensing Line Purge, Stainless steel
- Main Line Purge, Acrylic
- Main Line Purge, Stainless steel
- Pressure Switch, X-Proof
- Main Line Check Valve, Stainless steel
- Diagnostic and Inlet Gauges, Stainless steel

Bulletin 74.1:ACE95

Ordering Guide (continued)

Single Array Manifold (Optional)

- Yes, please add a SAM unit to my order. Please specify tank connection size and style (i.e. NPS 2 / DN 50, CL150 RF). Not available for In-Line bodies.

Parts Kit (Optional)

- Yes, please send one parts kit to match this order.

Specification Worksheet	
Application Specifications:	
Product in Tank	_____
Tank Size	_____
Pump In Rate	_____
Pump Out Rate	_____
Blanketing Gas (Type and Specific Gravity)	_____
Conservation Vent Setpoints:	_____ Pressure _____ Vacuum
Pressure Requirements (Please Designate Units):	
Maximum Inlet Pressure (P_{1max})	_____
Minimum Inlet Pressure (P_{1min})	_____
Control Pressure Setting (P_2)	_____
Maximum Flow (Q_{max})	_____
Other Specifications:	
Is a vapor recovery regulator required?	<input type="checkbox"/> Yes <input type="checkbox"/> No
Other Requirements:	_____
