

CSI 9420 Wireless Vibration Transmitter

The CSI 9420 delivers complete vibration information, including high resolution spectra and waveform, over a self-organizing wireless network for use by operations and maintenance personnel.

- Accurately monitors vibration and temperature in hard-to-reach locations
- Provides complete vibration including overall levels, energy bands, high resolution spectra, and waveforms
- Includes Emerson's patented PeakVue™ technology for bearing and gear diagnostics
- Delivers data and device alerts securely and reliably via IEC 62591 (WirelessHART®) networks
- Easily integrates into any host via Modbus or OPC with detailed diagnostics via AMS Suite software

Overview

The rugged CSI 9420 Wireless Vibration Transmitter is the first device to provide full vibration data over a self-organizing wireless network. It provides rich information about machinery health for both operations and maintenance personnel. Overall vibration, PeakVue, and temperature readings can be easily integrated into any control system or plant historian while diagnostic data can be displayed by AMS Suite: Intelligent Device Manager or any EDDL compliant host. For advanced diagnostics, high resolution data can be delivered to AMS Suite: Machinery Health Manager for trending and analysis.

WirelessHART

Cost-Effective, Reliable Monitoring

The CSI 9420 extends vibration monitoring to an entire array of new applications. While appropriate for most vibration monitoring tasks, it is especially well suited for hard-to-reach locations, such as cooling towers, pumping stations, remote equipment, and hazardous areas.

In general, the CSI 9420 provides an excellent solution for any application that might otherwise involve extensive engineering, cabling, or installation costs. Advanced electronics deliver a high level of accuracy, while the IEC-approved *WirelessHART* standard delivers exceptional reliability.

Overall Condition in the Control Room

The CSI 9420 delivers information about the overall health of rotating assets directly to the control room via Modbus or OPC. Overall vibration data is a good indicator of shaft problems such as imbalance, misalignment, or mechanical looseness. In contrast, the PeakVue reading provides a reliable measure of impacting on the machine. As the PeakVue level increases, it provides direct indication of a developing problem, such as improper lubrication, bearing fault, or gear defect. Process induced faults, such as cavitation, are detected by an increase in both the overall vibration and PeakVue readings.

Asset Dashboard at your Fingertips

AMS Device Manager generates an asset dashboard based on the output of the CSI 9420. This intuitive interface displays the health of the sensor, the transmitter, and the production asset being monitored – extending the benefits of PlantWeb® to *WirelessHART* devices. EDDL capabilities provide graphical presentation of diagnostics and a consistent user interface between manufacturers. When needed, the interface can also be used to view more detailed diagnostic data, including vibration energy bands and thumbnail spectra.

AMS Device Manager uses EDDL technology to create an asset dashboard with clear indication of device and asset status.

Diagnostic Data to the Maintenance Office

AMS Machinery Manager automatically communicates detailed diagnostic data to the maintenance office, including overall values, energy bands, high resolution spectra, and waveforms. Once stored in the AMS Machinery Manager database, these measurements deliver the same diagnostic value as comparable readings collected using Emerson's industry-leading CSI 2130 Machinery Health Analyzer.

AMS Machinery Manager provides advanced analytical tools to trend vibration levels, generate alerts, and diagnose developing faults.

Information Available When You Need It

When updated readings are required between scheduled measurements, you can initiate on-demand acquisitions from AMS Machinery Manager. This allows you to quickly and easily access current health information about your rotating assets without leaving your desk.

Flexible Configuration Options

The Power to Get Things Done

There are two power options for the CSI 9420. For a truly wireless experience, utilize the SmartPower Module. Based on the low power output defined by the *WirelessHART* standard, the CSI 9420 can achieve an operating life of up to 10 years when using the Power Save option (update rate set to 2 hours). An operating life of 3-4 years can be expected when using the default settings (update rate set to 30 minutes).

For faster update rates, the external DC-powered terminal block is recommended. This option provides virtually unlimited operation, even at the minimum update rate of once per minute.

Local Indication and Verification

The optional LCD display provides a local read-out of sensor values and transmitter diagnostics to streamline commissioning and troubleshooting at the device. Local indication of vibration measurements and diagnostics also provides accurate, real-time verification of operating conditions. The LCD display can be rotated to facilitate easy viewing, regardless of the orientation of the transmitter.

Plan and Manage Wireless Networks

The AMS Wireless SNAP-ON™ application is a revolutionary tool that enables you to both plan and manage your wireless network. Starting with a floor plan or aerial photo of the plant, utilize simple click-and-drag functionality to position the gateways and wireless devices. Then the AMS Wireless SNAP-ON application will compare the plan to industry best practices. Recommendations will help you quickly develop a reliable wireless network.

After the devices are installed, the AMS Wireless SNAP-ON application will help you manage the network, providing a graphical overview of the communication paths and network health.

Wireless Architecture Overview

Ultimate Simplicity

Built on the IEC 62591 (*WirelessHART*) industrial standard, Emerson's wireless network is completely self-organizing. There is no need to configure communication paths because the Smart Wireless Gateway manages this automatically – including adapting to changing environments. Once the network is established, new devices can be added at any time. Conversely, even if a device is de-commissioned, data reporting from other devices continues uninterrupted over other established paths.

Easy Installation

The CSI 9420, like all Emerson's Smart Wireless transmitters, is simple to install. As soon as power is applied to the device, it will automatically establish communication with neighboring wireless devices, establish a path to the Gateway, and begin reporting. Each transmitter also has the ability to function as a repeater, relaying data from other devices to extend the network across virtually any size facility or industrial campus.

Network Stability

The Smart Wireless Gateway connects the wireless network with the host system and data applications like AMS Suite. The Gateway manages all aspects of the network: executing scheduled readings and accommodating requests for on-demand acquisitions. The Gateway configures the network to minimize power consumption and ensure network stability, while maintaining data reliability well above 99%.

Best-in-Class Security

Emerson's multi-layered approach to wireless network security builds on the IEC 62591 standard to ensure that your data stays protected – no matter what. Authentication and verification make certain that only authorized devices can join the network, while 128-bit encryption shields your information. Channel hopping maintains operation, even in challenging environments.

The AMS Wireless SNAP-ON application graphically displays your wireless network.

Emerson's Complete Smart Wireless Solution

Emerson has a complete portfolio of Smart Wireless transmitters for many applications, including temperature, pressure, flow, and level. In addition, the Smart Wireless THUM™ Adapter can enable any HART device to wirelessly transmit measurement and diagnostic information. Emerson wireless devices can be accessed and maintained remotely using the same tools and software as wired devices, leveraging existing practices, training, and maintenance procedures.

Seamless Integration to Host Systems

Easily configure and broadcast measurements to any Modbus or OPC compliant host, including Emerson's DeltaV™ and Ovation™ digital automation systems or other plant automation systems and data historians.

Analyze Data in AMS Machinery Manager

Vibration data from the CSI 9420 can be stored and analyzed in AMS Machinery Manager. The Data Import module provides easy data mapping using simple drag-and-drop commands. AMS Machinery Manager combines predictive techniques with comprehensive analysis tools for an accurate assessment of the machinery health in your facility

At the heart of Emerson's Smart Wireless solution is the self-organizing network, featuring tight security, infinite configurability, and data reliability that rivals wired systems.

Detailed Reliability Data

Overall vibration and PeakVue value levels help you identify machines that may be developing mechanical faults. However, once a machine has been flagged, detailed data is required to pinpoint the exact cause and severity of the fault. With the advanced diagnostics in the CSI 9420, you have access to this critical information.

High Resolution Waveform

The vibration waveform (shown below) is the basis for all other vibration measurements performed by the CSI 9420. Each waveform is a complex data set of thousands of samples, collected over several seconds of machine operation.

The acceleration waveform contains raw vibration data that allows you to diagnose the health of the asset.

While the acceleration waveform can be helpful in some applications, the PeakVue waveform is indispensable for diagnosing developing bearing and gear defects. Because of their large size, however, waveforms tend to be collected less frequently. Emerson's Smart Wireless solution employs several data compression techniques to extract the information while facilitating easier transmission over the network.

High Resolution Spectrum

The first compression technique is FFT analysis, which transforms the vibration waveform into a frequency spectrum (shown below). This spectrum not only reduces the file size by over 60%, it also presents the frequency information in a more readable format. The smaller data set accelerates responsiveness of the system while reducing power consumption.

The elevated peaks in this high resolution spectrum provide a clear indication of mechanical looseness on the machine.

Thumbnail Spectrum

The thumbnail spectrum is derived from the same waveform data. It contains the same frequency and amplitude information as the high resolution spectrum, but the data set has been compressed by an additional 98%. Now it is small enough to transfer over the network in less than a second.

The thumbnail spectrum enables fast, low power operation, yet still offers information similar to the high resolution spectrum shown above.

Energy Bands

As a final data compression technique, the CSI 9420 divides the spectrum into three predetermined energy bands (as shown below). It then calculates the vibration energy within each energy band and passes these values to AMS Machinery Manager for trending and alerts.

Band	Fault Types	Range
1	Rotor Vibration: <i>Imbalance, misalignment (also defects on belt drives)</i>	2–65 Hz
2	Rotor Harmonics <i>Looseness, electrical faults, blade and vane pass</i>	65–300 Hz
3	High Frequency: <i>Bearing and gear defects, lubrication, and cavitation</i>	300–1000 Hz

Energy bands with frequency ranges. Optimized for a 4-pole motor running between 1500 and 1800 RPM. Note: bands are fixed.

By trending the values in AMS Machinery Manager and comparing them to appropriate alert levels, it is possible to set up a system of intelligent alerts that not only inform you when the machine condition is deteriorating, but also provide information about the underlying cause of the problem.

By dividing the spectrum into energy bands, we can isolate frequencies associated with different categories of faults.

The figure below illustrates how vibration data can be used to detect and diagnose a developing fault. Based on the increase in overall vibration (black line), an alert would flag the machine as having a potential fault – but with no indication at all about the nature or severity of the fault.

The trend of the three energy bands shows that the readings for rotor vibration (green) and rotor harmonics (blue) are stable, while the readings for high frequency vibration (red) have increased sharply. This would trigger a special alert for the rotating equipment specialist in AMS Machinery Manager.

Examination of the thumbnail spectra (shown above the trend) confirms that the fault is high frequency in nature. On-demand acquisition of the PeakVue spectrum and waveform then provides conclusive insight into the specific nature of the fault as well as its severity. Using the advanced diagnostics in the CSI 9420 and AMS Machinery Manager, maintenance personnel can often address and resolve an issue without it ever registering as an alert in the control room.

The trend of overall vibration suggests that machine health is deteriorating but without any indication as to the root cause. The trend of the high frequency energy band provides further insight, which can be confirmed by examining the thumbnail spectra.

Functional Specifications

Input

- Accelerometer 1
 - DC Bias Range: 2 - 3 Vdc
 - DC Input Range: 0 - 5 Vdc
 - AC Input Range: 2.5 Vpeak equivalent to 100 g's peak (980 m/s² peak)
- Accelerometer 2
 - DC Bias Range: 2 - 3 Vdc
 - DC Input Range: 0 - 5 Vdc
 - AC Input Range: 2.5 Vpeak equivalent to 100 g's peak (980 m/s² peak)
- Temperature
 - DC Input Range: -22°F to 250°F (-30° to + 121°C)

Output

- Machinery Health Values:
 1. Velocity overall (1 or 2 sensors)
 2. PeakVue overall (1 or 2 sensors)
 3. Temperature (1 sensor only)
- Transmitter Health Values:
 1. Ambient temperature
 2. Supply voltage
 3. Sensor bias voltage
- Advanced Diagnostics (optional)
 1. Energy bands
 - Rotor vibration (2 - 65 Hz)
 - Rotor harmonics (65 - 300 Hz)
 - High Frequency (300 - 1,000 Hz)
 2. Thumbnail Spectrum
 - Fmax: 150, 300, 600, or 1,000 Hz
 3. High Resolution Vibration Spectrum
 - Fmax: 1,000 Hz
 - Resolution: 800 or 1,600 lines
 - Snapshot or Averaged (4 readings)
 4. High Resolution Waveform
 - All measurements based on high resolution waveform with 4,096 points

Units

- English, metric or SI

Local Display

- The optional five-digit integral LCD display provides readout of HART parameters in engineering units (°F, °C, in/sec, mm/sec, g's and m/s²).
- Display updates for each transmission
- Maximum update rate - once per minute

Relative Humidity

- 0 - 95%

Temperature

- Storage Temperature:
 - 22°F to 185°F (-30°C to 85°C)
- Operating Temperature without LCD meter:
 - 22°F to 185°F (-30°C to 85°C)
- Operating Temperature with LCD display:
 - 4°F to 176°F (-20°C to 80°C)

Update Rate

- Standard: 1 min to 60 min (User selectable)
- Power Save: up to 24 hours (User selectable)

Physical Specifications

Power Options:

- Wireless Smart Power Module
 - Intrinsically safe
 - Replaceable
 - Lithium-Thionyl Chloride
- External DC-power
 - Input Voltage: 10 - 28 VDC
 - Provides unlimited operating life — recommended for applications requiring faster update rates

Operating Life¹

Configuration	1	2	3
Overall Values (min):	30	60	120
Energy Bands (hr):	8	8	8
Spectrum (hr):	24	24	24
Waveform (days)	30	30	30
Operating life (years)	3.5	6	9

Materials Of Construction:

- Enclosure
 - Housing — Low-copper aluminum
 - Paint — Polyurethane
 - Cover O-ring — Buna-N
- Terminal Block and Battery Pack
 - PBT
- Antenna
 - PBT/PC integrated omni-directional antenna

Mounting

- Vibration sensor must be mounted directly on asset being monitored
- Transmitter may be mounted up to 100' (30.5 m) away from sensor

Weight

- 4.6 lbs. (2 kg) without LCD
- 4.7 lbs. (2.1 kg) with LCD

Enclosure Ratings

- NEMA 4X/IP66

⁽¹⁾ Operating life with a single Smart Power Module based on a configuration with two accelerometers and running at an ambient temperature of 70°F (21°C). Continuous exposure to extreme temperatures may reduce operating life by up to 20 percent.

Performance Specifications

ElectroMagnetic Compatibility (EMC)

- Meets all relevant requirements of EN 61326.

Measurement Accuracy

- RMS Velocity: +/- 0.4 dB (Corresponds to +/-4%)
- PeakVue: +/- 0.4 dB (Corresponds to +/- 4%)
- Temperature: +/- 4°C

Note: Measurement accuracy is the absolute accuracy of the measurement relative to a known, calibrated excitation for *WirelessHART* devices. Values shown represent the expected performance operating under steady-state conditions (20°C with no external interference) for a mid-band excitation (nominally 1 g at 100 Hz). This variation includes the frequency response of the electronics and the sensor

Measurement Precision

- Vibration: +/- 0.2 dB over 24 months
- Temperature: +/- 2°C over 24 months

Self Calibration

- The analog-to-digital measurement circuitry automatically self-calibrates for each update by comparing the dynamic measurement to internal reference elements

Vibration Effect

- No loss in functionality when tested per the requirements of IEC60770-1 with high vibration level (10 Hz to 10 KHz) and up to 50g acceleration

Sensor and Connections

A0394 Sensor Series

- Nominal Sensitivity: 25 mV/g (2.5 mV/m/s²)
- Frequency Range: 96 to 600 Kcpm (1.6 to 10 kHz)
- Amplitude Range: ± 100 g (± 980 m/s²)
- Broadband Resolution: 3 mg rms (0.03 m/s² rms)
- Settling Time: ≤ 2 sec
- Temperature Range: -40 to +250°F (-40 to +121°C)
- Weight: 0.81 oz (23 gm)
- Sensor Type: Low profile, side exit integral cable

Terminal Block

- Two options for Terminal Block:

For Smart Power Module

For External DC Line Power

Sensor Connections

- Connector 1 — Red wire
- Connector 2 — White wire
- Connector 3 — Blank
- Connector 4 — Black wire

Single Sensor with Temperature

- Connector 1 — Red wire
- Connector 2 — White wire
- Connector 3 — Green wire
- Connector 4 — Black wire

Dual Sensors

- Connector 1 — Red wires (2 total)
- Connector 2 — White wire (Sensor 1)
- Connector 3 — White wire (Sensor 2)
- Connector 4 — Black wires (2 total)

HART Connection

- Connectors 5 & 6

External Power

- Connector 7 — Negative
- Connector 8 — Positive

Enclosure Type IP66

Approval Pending for external DC line powered version.

CSI 9420 dimensional drawing

Are You Wireless?

As any plant manager will tell you, you can't improve something if you can't measure it. Improved access to information provides the opportunity to reduce operating costs while improving quality, throughput, and availability. Add to that the expanding requirement to certify compliance with new environmental and safety standards. This all points to the need for increased monitoring, yet many managers still believe that the costs outweigh the benefits.

With wired systems, that may have been the case; however, wireless networks remove traditional barriers and redefine the cost equation. A wireless network can substantially reduce engineering, material, and implementation costs, and those cost savings are just the beginning.

Imagine what you can do with the additional information. Wireless technology can reduce – if not eliminate – the “blind spots” in your plant, while empowering mobile workers by providing needed information. The CSI 9420 provides predictive diagnostics for your essential production assets from virtually any location. The result is increased process uptime, improved consistency, and reduced risk of abnormal situations. As more and more plants are turning to wireless solutions, the question is “Are You Wireless?”

A CSI 9420 is an easy addition to any existing wireless network.
